

Modelling spectra of ultracool dwarfs:

- a) **First results of fits to Palle's telluric spectrum.**
- b) **New horizons of the “deuterium test”.**

modelling

Generally, the process of representing a real-world object or phenomenon as a set of mathematical equations. More specifically, the term is often used to describe the process of representing 3-dimensional objects in a computer.

Procedure II. Telluric spectra modelling

- High temperatures
- Thick atmospheres
- H- dominates
- TiO, VO, H₂O, methane
- Strong atomic lines
- Dust
- Low temperatures
- Thin atmosphere
- Line of H₂O, CO₂, methane, O₂, N₂....
- Photochemical processes
- Aerosols
- Photochemical processes

Modelling spectra

- One slab model atmosphere
- Line by line computations (TASS)
- Absorption by lines is treated explicitly (Voigt profiles, damping constants... etc.)
- Model atmosphere
- Model of molecular bands (MODTRAN):: smoothed opacities
- Low resolution spectra

Conclusions I.

- Palle et al. (2009) observed really transmitted and reflected light of the telluric atmosphere.
- Earth is the first rocky planet discovered spectroscopically.
- If something is possible at once, it can be repeated many times...

ANY SPECTRUM CAN BE **and**
MUST BE CONVERTED INTO
NUMBER(s)

Minimisation procedure

- Zero order densities.
- Compute spectrum
- Compute $S = \sum (1 - F_i/F_{obs})^2$
- Density of i-species increased/decreased by factor X
- If $S_{j-1} > S_j < S_{j+1}$ then we try another specie.
- Process iterates till a convergence for ALL species.

Summary II.

- All features are identified.
- Different molecules provides different sensitivity on T and P.
- Our procedure provides reliable fits:)
- Abundances can be obtained ONLY if temperature is known.
- UNFORTUNATELY, WE CANNOT MODEL OUR OWN ATMOSPHERE:(

Methane and heavy methane spectra in the “deuterium test”

- Bejar et al. (1999) idea of the “deuterium test”.
- CH₄, CH₃D, H₂O line lists from HITRAN
- 1D slab model atmosphere of T = 200 K.
- Line by line computations of fluxes.
- Spectral resolutions were adopted 1.6 Å, 6 Å, 80Å (R=10000, 2000, 200 at 1.6 micron).

Summary

- The situations looks like with H₂O/HDO
- Task for future ELT?
- Another species should be tested...

Solar twin spectra

Comparison of spectra of solar twins (Motives by
Martin et al. 2002, ApJ, 579, 437).

ADS103a, ADS103b

Summary

- To be continued...
