

Searching for transits with WTS

Gábor Kovács

ESR at Institute of Astronomy
Cambridge

WFCAM Transit Survey

- Project on UKIRT telescope
 - UKIRT is operated in queue mode, WTS is a fallback programme
 - Runs since 2007, till 2012
- Targets low mass stars, J band
 - 4 fields, observed usually at the beginning of nights
- Long time range, few epochs with big gaps, faint objects
 - 03h: 300 07h: 365 17h: 380 19h: 1000

Images → LCs → Candidates

- UKIRT WFCAM images processed in Cambridge
 - basic reduction by CASU
 - WTS specific processing based on CASU tools
- Release to the RoPACS Network
 - WTS images re-processed → lightcurves
 - Transit search (occfits) → candidates
- Follow-ups, various studies in the Network

Tasks

- Pipeline development
 - built from existing low-level components
 - continuous improvement for releases
 - ensure quality and reproducibility
 - support for follow up steps
- Sensitivity analysis
 - mapping observational results onto theory
 - improvement in processing

Pipeline: light curve production

- Input:

- Reduced WFCAM images
- Master frame / catalogue

- Postprocessing

- normalization
- seeing correction
- outlier filtering
- possible others

Coordinate information

RA	DEC	Coord. epoch
10.0	20.23	23000.0
10.1	20.24	23000.0
10.2	20.25	23005.0

Occfit information

No occfit data for this object.

WTS home | Blabla

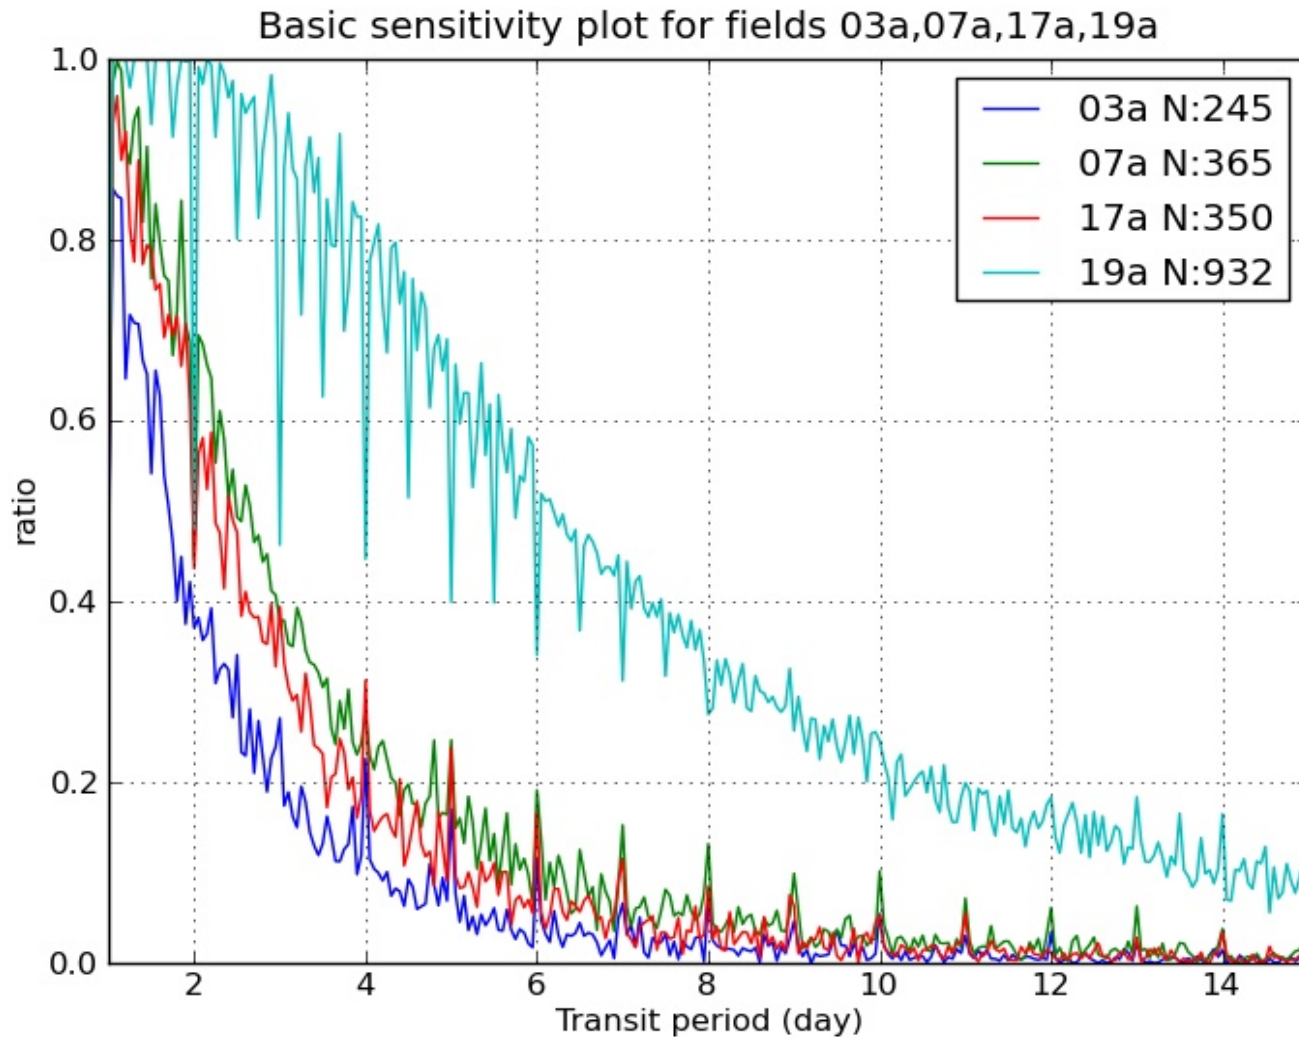

The WFCAM transit search candidate tracker system.

Done

Sensitivity analysis

- Insert transit signals into real data
 - Includes all the noise, systematics, detection difficulties
 - Include host-planet system parameters
 - Detection or non-detection contributes to systems statistics
 - Monte Carlo approach: drawing system parameters, calculate transit shape, add to a “flat” M dwarf lightcurve

Sensitivity analysis 1

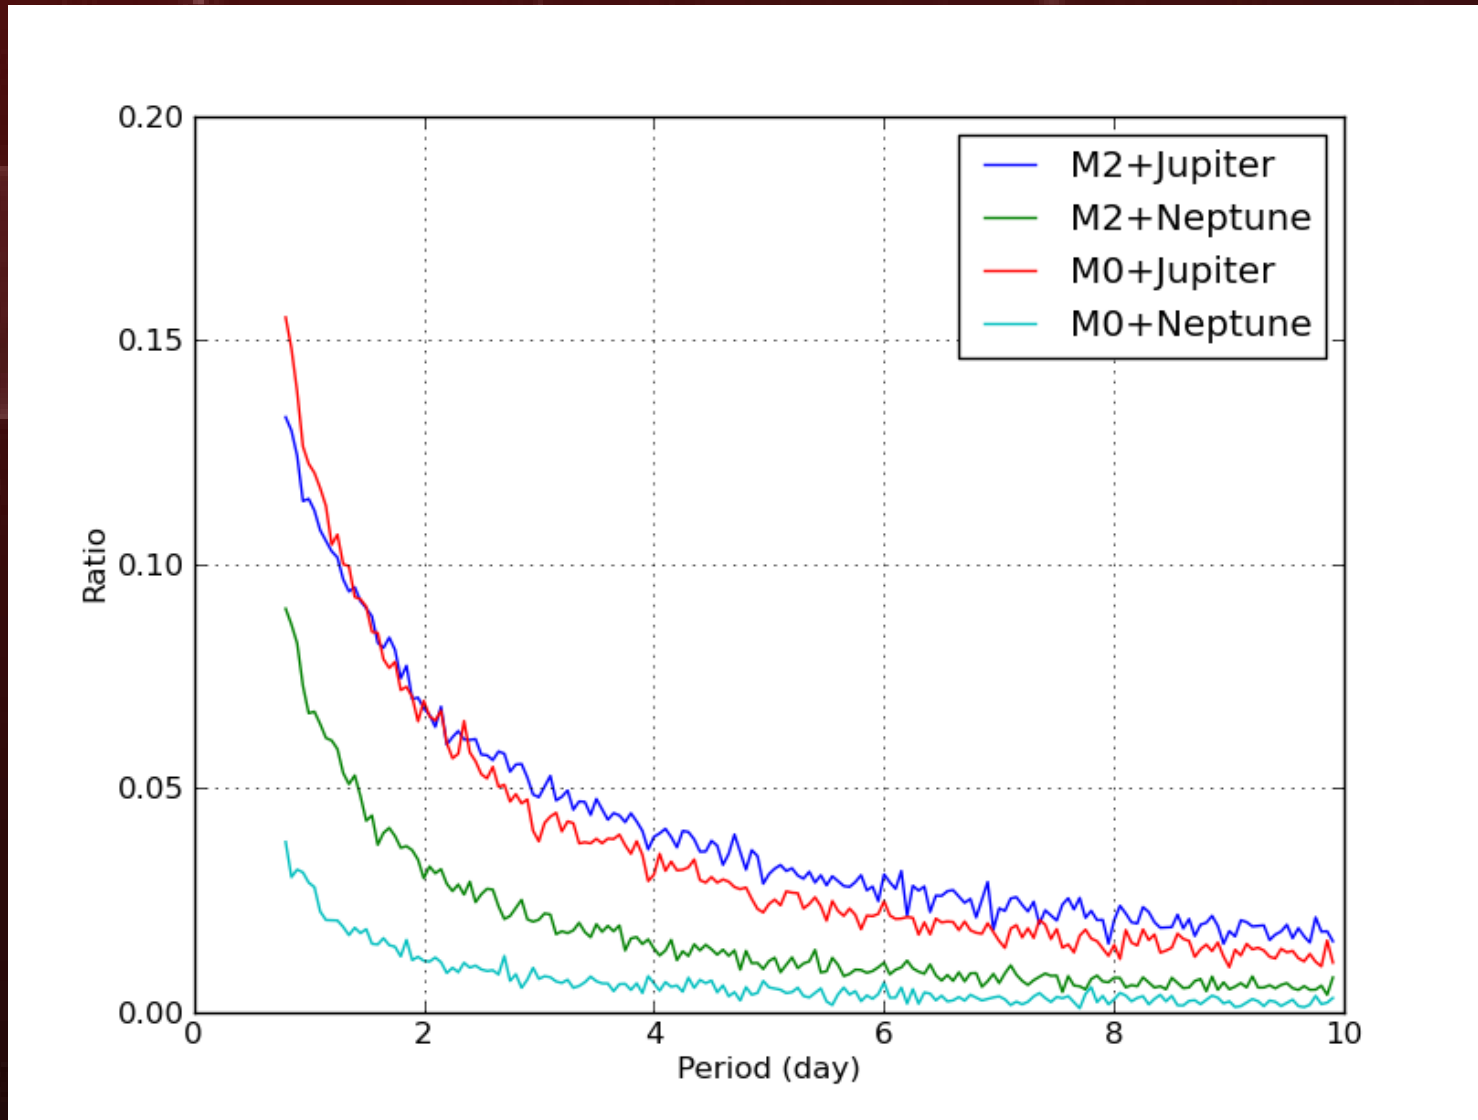

Sensitivity analysis 2

Ms	Rs	Mp	Rp	True positive	Recovery fraction
0.4	0.4	1.0	1.0	0.85	0.92
0.4	0.4	0.35	0.6	0.81	0.72
0.6	0.6	1.0	1.0	0.87	0.82
0.6	0.6	0.35	0.6	0.51	0.41

Sensitivity analysis 3a

Sensitivity analysis 3b

Sensitivity analysis 4

- Expected number of a certain system if all M dwarf had one, multiply by:
 - transit probability (geometry)
 - true positive ratio
 - number of M dwarf stars in our fields
- If we detect none → constraint on system occurrence

Future

- Short term goals:
 - publish results
 - prepare new release
- Long term:
 - follow up and confirmation steps → find planets

A dark space background filled with numerous small white stars. On the left side, there is a smaller, reddish-brown planet. On the right side, there is a larger, blue and white planet, resembling Earth. The text "Thank you !" is centered in the middle of the image.

Thank you !

3 December 2010

RoPACS midterm meeting

Field of view: 1.6 sq deg per field
Exposure: 10s
Cadence: 16min

M dwarfs J=16: 6000

exoplanets.org
exoplanet.eu

All: 452 planets,
Transiting: 79 planetary systems
